BBDU / INSTITUTIONAL INTELLIGENCE

From student strength to research output

A visual, evidence-led reading of the IBM Cognos dashboard and the public data behind it.

12,047	8,694 / 3,353	179	4
STUDENTS · 2025 NIRF	MALE / FEMALE	PHD PURSUING · 2023–24	PATENTS GRANTED · 2023

Prepared by Yugraj Singh · BBA — Business Analytics

IBM Cognos Analytics | Reporting window shown in dashboard: 2019–2026*

One dashboard, several linked questions

The dashboard brings together student scale, admissions, placements, salary indicators and research outputs. Its value is not a single score; it is the ability to move from an institutional snapshot to a focused question, then inspect the evidence and its period.

WHAT THE DATA SAYS	WHAT IT DOES NOT SAY
The 2025 NIRF student-strength rows sum to 12,047: 8,694 male and 3,353 female. The gender split is about 27.8% female.	This snapshot is not a live enrollment count or a year-by-year growth series. The source does not give a snapshot academic year in this table.
The dashboard exposes placement activity by year and program filters; the screenshot tooltips show 1,559 placed in 2020 and 1,270 in 2026, with 2026 explicitly marked ongoing.	A partial-year 2026 value cannot be compared with a completed year. Recruiter visits and placements move together in some years, but screenshots alone do not establish a causal relationship.
The five-year ending-2023 bubble view reports 131 PhDs awarded, 62 recognized research guides and 29 patents awarded; the separate annual 2023 patent row reports 29 published and 4 granted.	The bubble’s five-year aggregates and the annual 2023 flow are different measures. They should not be summed or treated as the same cohort.

Analyst’s framing: treat the dashboard as a navigation layer over heterogeneous public reporting—not as one perfectly synchronized annual dataset. The safest interpretation names the metric, reporting period, and source on every comparison.

What this dashboard is designed to help answer

A compact institutional intelligence view for exploring how scale, educational progression, employment outcomes and research indicators appear across the sources assembled for BBDU.

01

How large is the student body?

Headline student, gender, location and program-level slices establish an institutional snapshot.

02

Where does capacity sit?

Sanctioned intake and program-level filters let a viewer compare the composition of admissions capacity.

03

What do reported outcomes show?

Placements, recruiters and salary indicators give separate views of employment outcomes.

04

What does research activity look like?

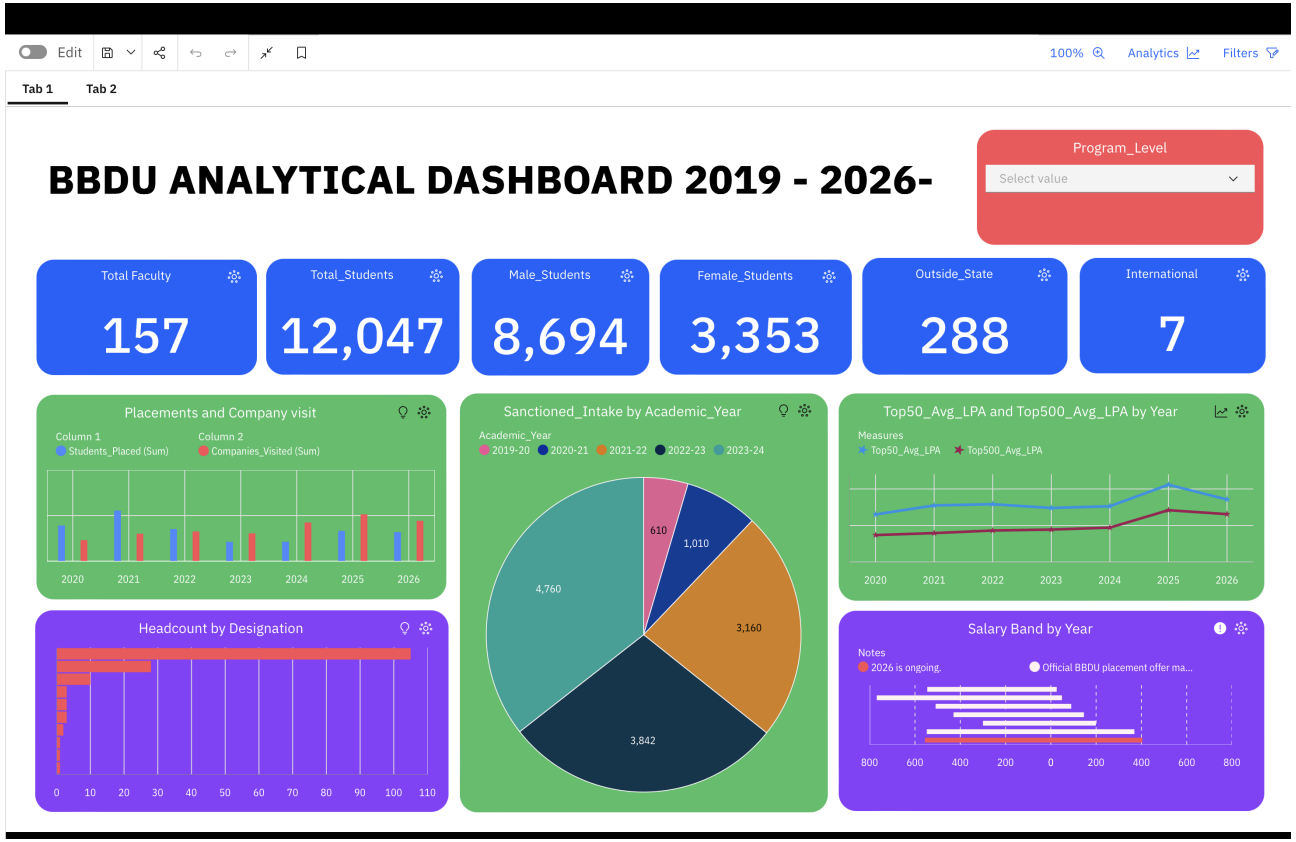

PhD, guide and patent indicators provide a high-level view of research output and capacity.

The analytical job

Connect the question to a specific metric and a specific evidence period. Keep student-strength snapshots distinct from admissions cohorts; distinguish placed graduates from graduates; separate annual patent flows from multi-year research totals; and expose where the workbook does not contain enough detail to support a stronger claim.

A single screen connects the main storylines

The opening view combines headline indicators with six supporting charts. Use the filter to explore populations; read the date and metric labels before comparing values.

Overview screenshot supplied by the presenter. Dashboard shows 2019–2026; 2026 is flagged as ongoing. KPI values match the 2025 NIRF strength rows in the workbook.

The baseline: 12,047 students in the 2025 submission

The workbook contains seven NIRF 2025 strength rows across UG, PG and PG-Integrated categories. Reconciliation across rows gives 12,047 students, with 8,694 male (72.2%) and 3,353 female (27.8%). The outside-state and international fields sum to 288 and 7, respectively.

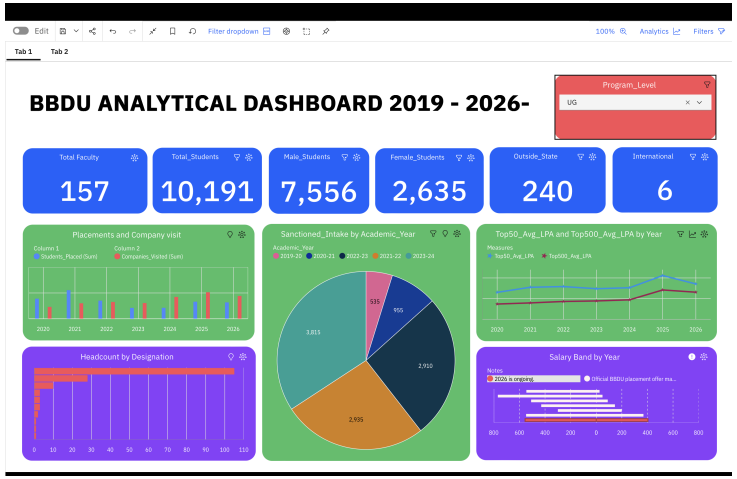

Program level	Students	Male	Female	Outside state	International
UG	10,191	7,556	2,635	240	6
PG	1,481	911	570	45	0
PG-Integrated	375	227	148	3	1
Total	**12,047**	**8,694**	**3,353**	**288**	**7**

The filtered dashboard screens show UG 10,191; PG 1,481; and PG-Integrated 375. These are views through the dashboard filter. Treat them as categories; do not add the filtered totals to the unfiltered total.

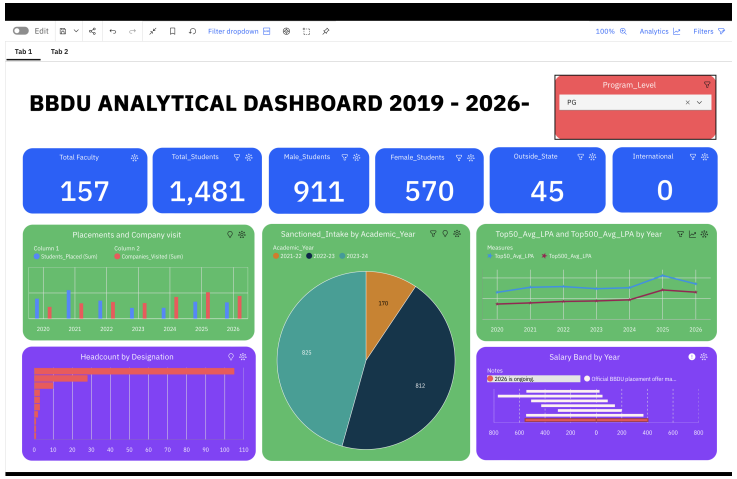

The source labels this as actual student strength but does not state the snapshot academic year in the table. It is a submission-year snapshot, not a 2019–2026 trend.

Filters change the population—and the meaning of the KPI

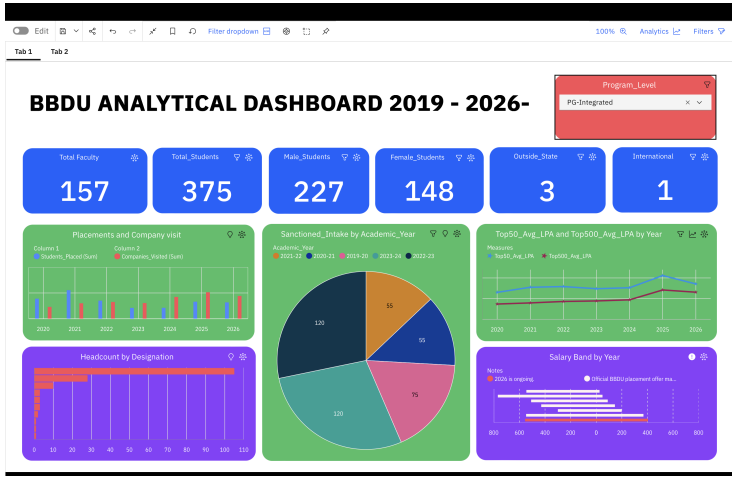

The three screenshots below demonstrate the dashboard's Program_Level control. Their purpose is to show how a broad institutional view becomes a focused slice. The totals are directly visible in the screenshots and reconcile to the source categories where applicable.

UG · 10,191 students

PG · 1,481 students

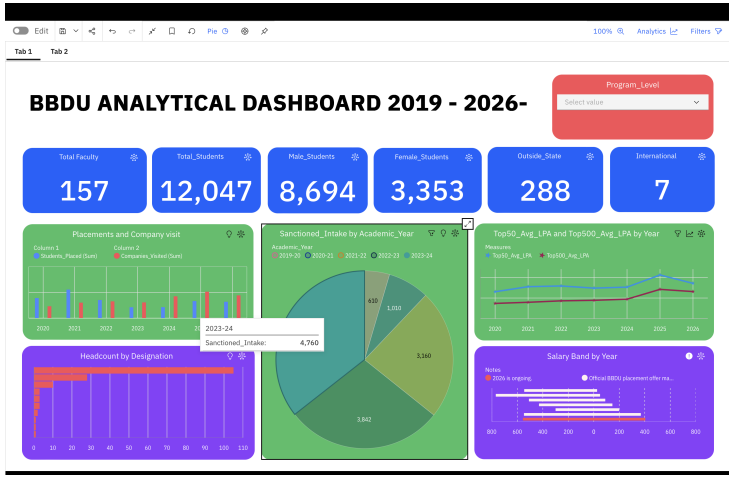

PG-Integrated · 375 students

For comparisons, preserve the same definition and report date. The BBDU workbook's NIRF 2025 snapshot uses program-level categories; UG/PG filter screenshots are a view of those categories.

Capacity is not enrollment

The dashboard’s sanctioned-intake visualization is a cohort view. The tooltip identifies 4,760 sanctioned intake for 2023–24. Sanctioned capacity describes seats authorized for intake; actual enrolled students can differ.

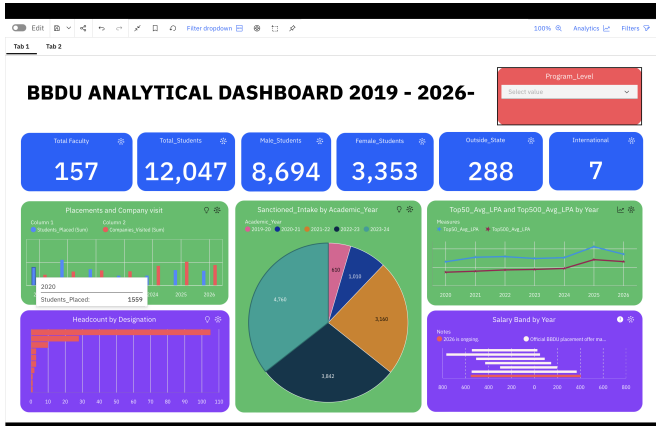

2023–24 sanctioned intake tooltip.

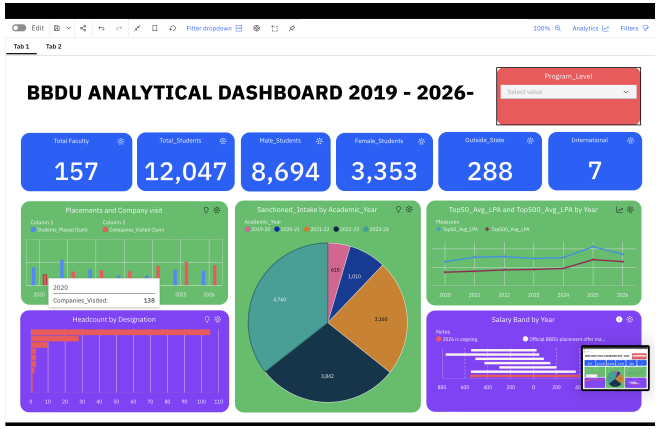

Interesting relationship: admissions occur at cohort entry; placements and PhD completions show up years later. Aligning a cohort’s entry year with its graduation year is essential before interpreting conversion or success.

Placement and recruiter visits should be read side by side

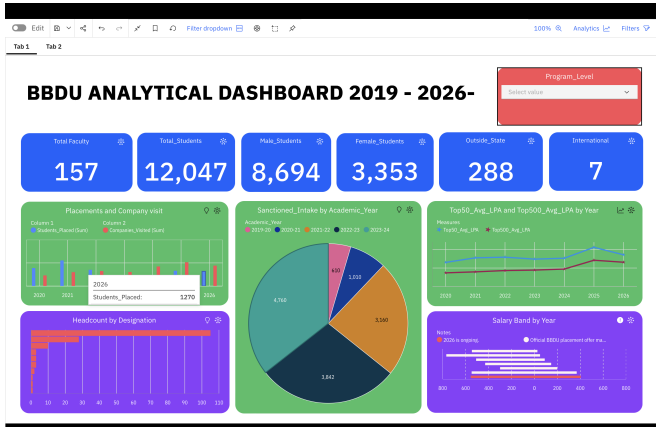

The chart uses distinct series for students placed and companies visited. In the supplied tooltips, 2020 shows 1,559 placements and 138 company visits; 2026 shows 1,270 placements and 265 company visits. The dashboard marks 2026 as ongoing, so the later-year count is incomplete.

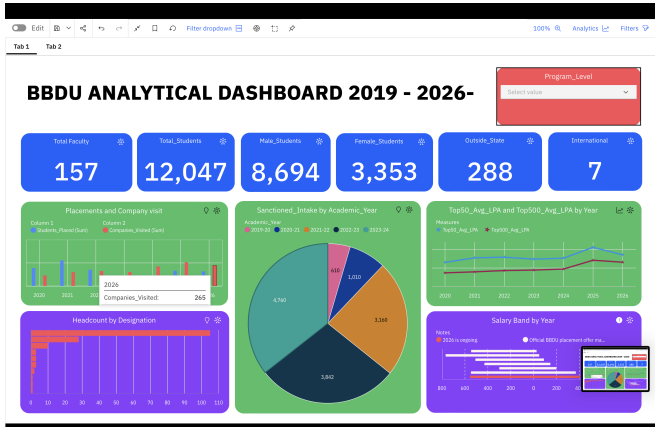

2020 · students placed: 1,559

2020 · companies visited: 138

2026 · students placed: 1,270

2026 · companies visited: 265

The chart shows association, not causation. Year length, cohort size, reporting coverage and placement definitions may also matter.

A fair comparison needs the same finish line

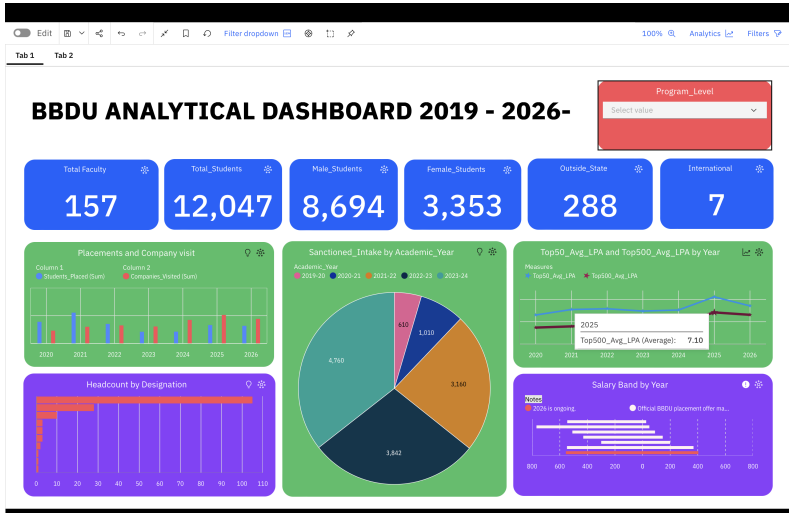

The screenshot’s year-by-year placements series is useful for monitoring activity. For outcomes comparisons across programs, the workbook’s NIRF rows are cohort-based and report placed students among graduates in minimum stipulated time. These measures are not interchangeable.

Level / duration	Graduated in minimum time	Placed	Median salary
UG · 3 yr	1,043	551	■3.24 LPA
UG · 4 yr	376	232	■3.25 LPA
UG · 5 yr	203	31	■4.68 LPA
PG · 1 yr	103	0	Not reported / 0
PG · 2 yr	515	369	■3.82 LPA
PG · 3 yr	43	37	■8.10 LPA
PG-Integrated · 5 yr	50	26	■3.40 LPA

For 2023–24 reporting, the table includes several program-duration rows with very different placement counts and medians. A cross-program comparison should include denominator, cohort duration and whether the salary statistic applies only to placed graduates. It is not an institution-wide average package.

Salary charts are signals; disclose the underlying definition

The dashboard displays Top 50 and Top 500 average LPA by year, plus a salary-band distribution. The workbook provides NIRF median salary values for placed graduates, but not the dashboard’s Top 50/Top 500 series or band counts.

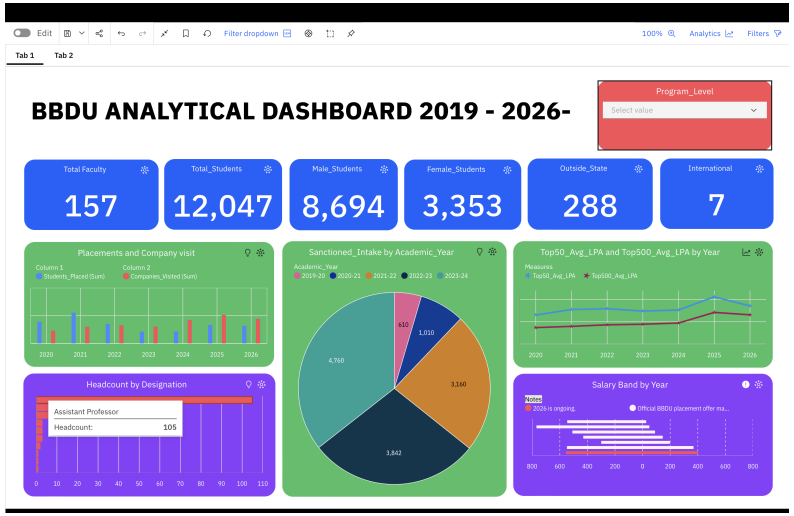

The 2025 tooltip reads 7.10 LPA for Top500_Avg_LPA. This is a screenshot observation, not a workbook-reconciled value. The salary-band chart flags 2026 as ongoing; a tooltip reports 404 students in the 5–8 LPA band. Do not treat it as a complete-year distribution.

Recommendation: define “Top 50 / Top 500,” salary unit, whether offers or accepted placements are counted, and the cut-off date for ongoing years.

Read faculty indicators with a coverage label

The overall dashboard KPI displays 157 faculty. A tooltip identifies 105 Assistant Professors. The workbook’s roster contains only 42 source rows recoverable from NIRF 2025 text and is marked partial. It cannot validate the full 157 total or support a complete designation mix.

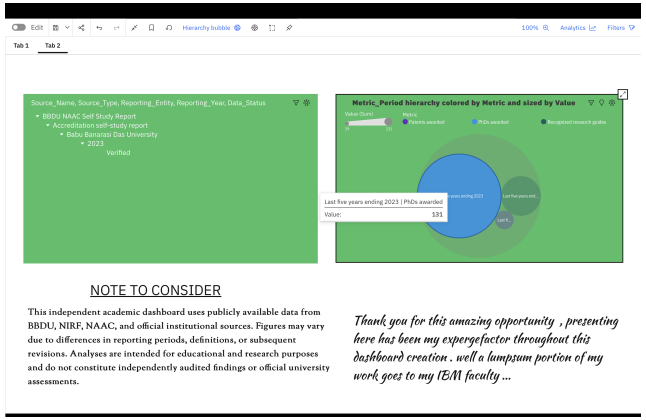

The dashboard reports a 157 faculty KPI and a 105 Assistant Professor tooltip. The workbook extract cannot confirm the remaining designation counts or serve as a full roster.

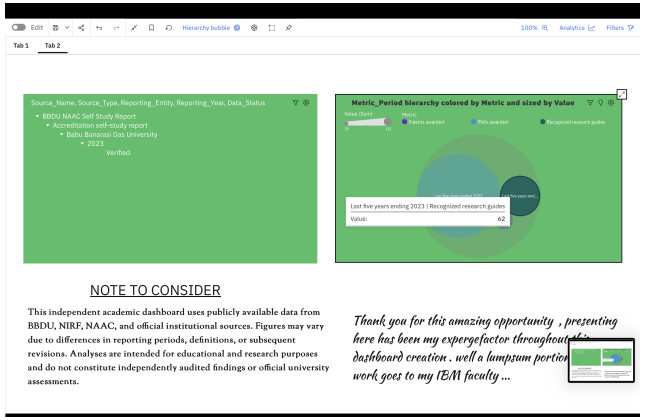

Use a complete dated faculty schedule before publishing designation shares, faculty-to-student ratios or year-on-year growth.

The dashboard’s research view spans five years ending 2023

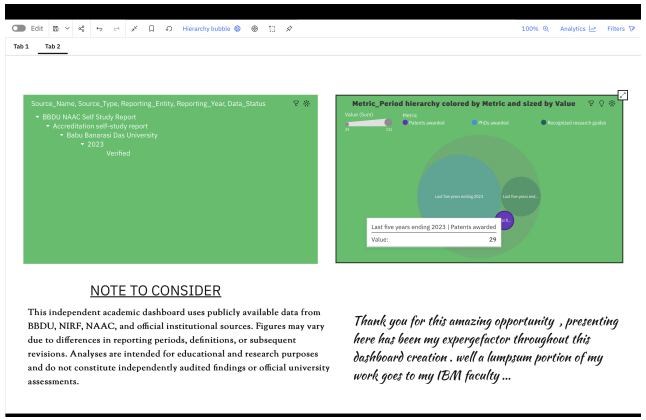

The second dashboard tab groups research indicators by a shared period label. Tooltips show 131 PhDs awarded, 62 recognized research guides and 29 patents awarded for the last five years ending 2023. The bubble size communicates relative magnitude; it is a visual comparison across unlike measures, not a score.

PhDs awarded · 131

Recognized research guides · 62

Patents awarded · 29

A useful connection: doctoral completions, guide capacity and patents are adjacent parts of a research ecosystem. The data do not establish a causal chain.

PhD stock and PhD completions are different measures

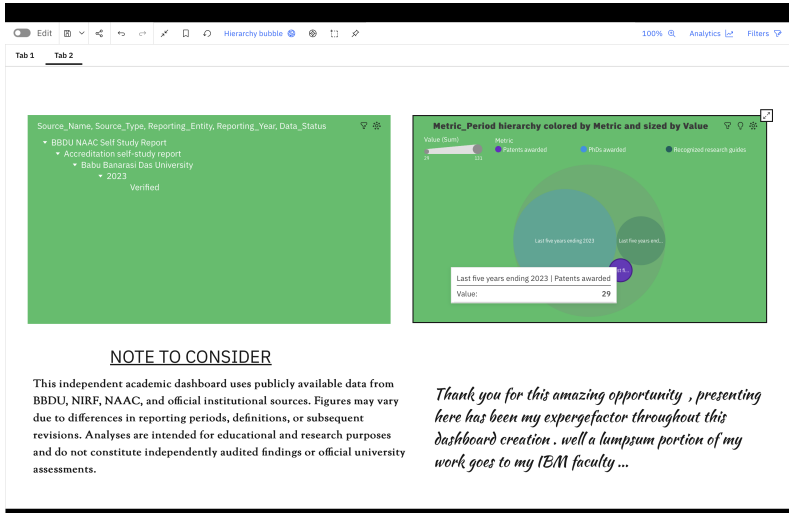

The workbook’s NIRF 2025 PhD table records 179 students pursuing PhD at the end of 2023–24 (17 full-time and 162 part-time). It separately reports 29 PhD graduates that year (4 full-time and 25 part-time). The dashboard’s five-year bubble value of 131 is a broader period aggregate, not the 2023–24 annual completion count.

Metric	Full-time	Part-time	Total
Pursuing at 2023–24 close	17	162	**179**
Graduated during 2023–24	4	25	**29**

This distinction matters for planning: pursuing is a point-in-time stock; graduates are annual completions. A progression or completion rate would require linked entry cohorts, time-to-degree and a consistent denominator.

Published and granted patents are separate annual flows

The NIRF 2025 patent schedule lists 29 patents published and 4 granted during calendar 2023. The dashboard tooltip shows 29 patents awarded across the five years ending 2023. These differ in period and status.

Patent publication and grant events can occur at different stages and may refer to different cohorts. The workbook lists annual grants of 6 (2020), 0 (2021), 2 (2022) and 4 (2023). Do not infer a linear trend from four observations or combine published and granted counts as unique inventions.

What the evidence supports—and where it stops

Observed pattern	Careful interpretation
Placements and company visits are both plotted over years.	Possible association in timing. No causal conclusion without comparable completed-year observations and additional context.
Student strength differs substantially by program level.	A structural composition difference in the 2025 snapshot. Not enrollment growth; not an outcome measure.
The five-year research bubble includes PhDs, guides and patents.	A useful portfolio view across indicators. Metrics are unlike measures and do not establish a causal chain.
The dashboard salary and faculty values include tooltip-level details.	Helpful for exploration. Some metrics lack a corresponding complete workbook series, so cite the dashboard screenshot and label them accordingly.

A concise claim rule

For every headline: state the number, unit, population, period, source and whether it is a stock, annual flow or multi-year aggregate. If any one of these is unclear, describe the chart rather than making a stronger claim.

Make the next version easier to trust and act on

01 Put the reporting period beside every KPI

Add a source-year and cut-off label; keep the ongoing 2026 status visually prominent.

02 Standardize metric definitions

Explain placement, company visit, salary band, average salary and “Top 50 / Top 500” in a short data dictionary.

03 Build a cohort bridge

Link admission year, program duration, graduation year, placements and higher studies with a stable cohort key.

04 Strengthen faculty coverage

Replace the partial roster with a complete dated faculty extract before calculating staff mix or ratios.

05 Separate research periods and states

Show annual published / granted patents separately from five-year “awarded” counts; make doctoral stock and completions distinct.

06 Add source and refresh metadata

Display report title, table/page and last refresh date in the dashboard or an accompanying evidence panel.

How to read this report

Workbook source: BBDU_Public_Data_Master_Updated.xlsx. The values cited here were checked against the workbook's named data sheets and source notes. NIRF submissions are institution-reported public disclosures; verification against the workbook/source is not an independent audit. Missing fields are not treated as zero.

Topic	Treatment in this report
Student strength	Use NIRF 2025 submission snapshot. Source table has no stated snapshot academic year. Reconcile seven level/duration rows; do not sum annual snapshots.
Placements / PhD	Keep graduation-year cohort outcomes distinct from annual dashboard placement activity. Median salary is for placed graduates as reported, not an average.
Faculty	Dashboard shows 157 total and a 105 Assistant Professor tooltip. Workbook roster has only 42 recoverable rows and is explicitly partial.
Research / patents	Label five-year ending-2023 bubble values separately from annual NIRF 2023 patent status counts.
Dashboard-only observations	Cite screenshots for Top500 tooltip, salary bands and filtered KPI views not present as equivalent series in workbook.

The 2025 NIRF PDF URL was present in the workbook source notes; at the time of the prior workbook audit, the direct link returned 404. Links are included for provenance and may move.

From a dashboard view to a stronger evidence habit

This project turns scattered institutional indicators into a navigable story: who is represented in the student snapshot, how capacity and outcomes are viewed, and what the reported research indicators show. Its strength is the invitation to ask a focused question. Its next step is to make each number's period, population and definition as visible as the number.

> *The most interesting connection is temporal: student strength, admissions capacity, placements and doctoral completions describe different stages of an institutional pipeline. Reading them together can guide better questions—but only cohort-aligned data can answer whether one stage predicts another.*

Acknowledgment

Prepared by Yugraj Singh, BBA — Business Analytics. With thanks to the IBM faculty for guidance throughout the dashboard creation process.

Thank you for this amazing opportunity , presenting here has been my expergefactor throughout this dashboard creation . well a lumpsum portion of my work goes to my IBM faculty ...

For educational and research purposes. This independent reading is not an official university assessment.
